

All medication (prescription, over the counter and medication that needs to be refrigerated), poisonous and hazardous materials/chemicals must be secured in a closet, container or cabinet with a rotating lock (key, combination or magnet), which is inaccessible to children. The locked area cannot be a laundry room or bathroom and should not be a closet or cabinet that is opened on a regular basis for any other reason. If needles are required to administer medication to anyone in the home, these must also be locked. Combustible items must be stored away from any heat source and it is highly recommended that they are locked up. All keys that access these items must be kept in a separate location.
